Third-party Providers
Monitoring

Dendro Poland. Third-party providers monitoring

CUSTOMER

Dendro Poland is a chemical and furniture manufacturing company, and one of the largest and most modern factories producing foam mattresses in Europe. It is a dynamically developing company, whose main client is IKEA.

CHALLENGE

Hiring third-party contractors became an essential part of Dendro Poland's business strategy. While working with remote vendors, a major security issue arises. As independent contractors share the privilege of accessing Dendro Poland's network with regular employees, how to protect corporate servers from unauthorized changes?

Dendro Poland has received audit's recommendations for monitoring the work of third-party providers on the corporate servers.

SOLUTION

Ekran System was deployed on Dendro Poland's servers, to which external contractors were granted access. Ekran System monitoring features allowed to ensure that the outsourced staff does only assigned tasks and that their actions do not cause security problems.

Dendro Poland's IT Department uses Ekran System at the level of basic functionality: they record all actions of users, who log into the monitored servers, in order to audit the changes made by them.

Ekran System Reports and Statistics feature became a valuable addition to the complete per-session video logs, as it provides the full overview of the third-party providers activities on each server.

“Ekran System product completely meets our requirements,” said Maciej Galiński, Senior Application Specialist - IT Department, Dendro Poland. **“Its maintenance is intuitive, and configuration is easy and painless.”**
